David Garner

Technical Lead

dprgarner@gmail.com · Github · LinkedIn

I'm a full-stack web developer and technical lead based in London. I have many years of experience with **TypeScript, Python, Node.js, and React**, and I'm comfortable working across the whole stack and the whole development life-cycle. I place a strong emphasis on quality, collaboration, and ownership in my work, and consider code review and automated testing to be essential parts of the development process.

Employment History

August 2026 - Present: Which? (Contract role - London, UK)

I worked with a team at the consumer charity Which?, building a new iteration from the ground up of a core product with distinct user journeys for consumers, third-party businesses, and backoffice staff, in an asynchronous-first monorepo architecture.

- **Key Technologies:** TypeScript, Nest.js, Next.js, React, Copilot, AWS (ECS, SQS, EventBridge), Terraform
- **Key Skills:** Event-driven architecture, monorepos, estimation, planning, unit testing.

June 2025 - April 2026: Natcap (Contract role - London, UK)

I worked with a small development team at the nature-intelligence company Natcap. Working on the company's enterprise-grade security project, I migrated the company's customer platform from a home-made identity provider onto the Auth0 platform, and designed and implemented a role-based access control framework for their platform.

In addition to the security project, I made major improvements to the developer process by rearchitecting the CI workflows and introducing browser-run visual regression tests.

- **Key Technologies:** Python, Auth0, OAuth 2.0, AWS (including EKS and Cloudwatch), Kubernetes, Helm, Terraform, PostgreSQL, GraphQL, Apollo (client & server), TypeScript, SQLAlchemy, FastAPI, Playwright, GitHub Actions, Copilot;
- **Key Skills:** Role-based access control, writing documentation, code review, automated testing (unit, browser, visual regression).

September 2024 - April 2025: Eurostar (Contract role - London, UK)

I worked with several teams of experienced contractors at the multinational company Eurostar, across a large primarily-TypeScript codebase consisting of new and legacy apps and microservices, creating new features and addressing production bugs on their platforms for train customers and station staff.

I implemented the passenger-specific messaging for the EU's upcoming Entry/Exit System across multiple platforms, including web and mobile apps, Google Wallet, Apple Wallet, and PDF printed tickets. I also made technical and customer-facing improvements to the web app seating maps for Eurostar trains.

- **Key Technologies:** TypeScript, React, Node.js, GraphQL, Apollo (client, server, federated schemas), Next.js, AWS (Codedeploy, Lambda, SQS), CircleCI, Google/Apple wallet, React Native, Grafana, Terraform;
- **Key Skills:** UI design systems, code review, CI/CD, microservices, monorepos, bug triage and monitoring, automated testing (including unit, integration, and in-browser).

January 2024 - June 2024: Camion (Contract role with YLD - London, UK)

As part of the initial tech team of contractors on a completely greenfield project, I delivered Camion's flagship product from concept to production within three months, in which our small fast-moving team made all the foundational architectural and technical decisions while also introducing Agile processes such as stand-ups, Kanban boards, and roadmaps.

We delivered a web app which allowed customers to determine the potential value of installing electric vehicle chargers at different locations via an interactive map of the UK, presenting in-depth analysis at individual points and across larger areas, with tools to customise their portfolios of potential sites and to export the analysis into CSV and PDF formats.

- **Key Technologies:** TypeScript, React, Node.js, Next.js, AWS (Cognito, Lambda, SAM, S3), Vercel, PostgreSQL with PostGIS, Mapbox, deck.gl, Google Maps, Tailwind;
- **Key Skills:** GIS technologies, authentication, code review, estimation and planning.

January 2023 - December 2023: Zoa (Contract role with YLD - London, UK)

I worked with the energy tech start-up Zoa as it broke away from Bulb to form an independent company creating white-label apps and tools for energy suppliers. I participated in several key architectural design discussions and decisions for this greenfield codebase, particularly with their monorepo for web apps, native apps, and backend-for-frontend services.

I implemented the core code of an EV-charging web and native app, designed a platform-agnostic approach for client-side navigation, and helped create an internal design system with an emphasis on accessibility, universality between web and native, and ease-of-integration for developers.

- **Key Technologies:** TypeScript, React Native, Node.js, Expo, Next.js, CircleCI, Bitrise;
- **Key Skills:** Universal JavaScript (client & server, web & mobile), UI design systems, accessibility, monorepos, code review.

January 2022 - December 2022: Bulb (Contract role with YLD - London, UK)

I maintained the existing smart meter integrations for Bulb's 1.6 million customers, while also implementing new features in the React Native mobile app and its backing microservices.

Within a small team I created features to allow customers to view estimates of the breakdown by category of their household energy usage and their spending in relation to similar homes. I played a key role in the technical and architectural designs of these new features, and strategies for their seamless incremental roll-out within an A/B test.

- **Key Technologies:** TypeScript, React Native, Node.js, GraphQL, Apollo Client, Apollo Server, GCP (including BigQuery, GKE, PubSub, IAM), Kubernetes, Terraform, Firebase;
- **Key Skills:** Mobile app release, push notifications, code review, unit testing, bug triage.

April 2020 – October 2021: Policy Expert (London, UK)

I joined the JavaScript team of a home insurance company as a **senior front-end lead**, taking ownership of these codebases as the **technical lead** from November 2020.

I led front-end rebuild projects of major sections of our customer-facing and back-office apps, and assisted with technical initiatives on the containerisation of our services and modernisation of our front-end frameworks.

- **Key Technologies:** TypeScript, Node.js, React, Express, Docker, AWS (including CloudFormation, CloudFront, Fargate, Lambda), RxJS, Module Federation with Webpack (microfrontends), TeamCity;
- **Leadership skills:** Interviewing, setting take-home assessments, onboarding, gathering business requirements, prioritising tech-debt, team training;

- **Development skills:** Domain-driven design, event-driven architecture, microservices architecture, code review, agile processes, unit testing, A/B testing, user-behaviour analytics, error monitoring.

August 2015 – March 2020: Mintel (London, UK)

At the market research agency Mintel, I worked on multiple brand-new and decades-old in-production codebases. I created and enhanced web apps for searching, reading, and exporting long-form content, and apps to view consumer survey data in tables, charts, and dashboards.

After being promoted to a **technical lead** in March 2019, I successfully orchestrated a major project combining two of Mintel's existing core products, coordinating the development work with seventeen developers based in London, Chicago, and Shanghai.

- **Key Technologies:** JavaScript, React, Redux, Python, Django, Solr, Elasticsearch, Jenkins, Selenium, Bash scripting, Unix CLI utilities;
- **Leadership skills:** Requirements gathering, tech-debt prioritisation, interviewing candidates, presenting talks and workshops;
- **Development skills:** Agile processes, automated testing (unit, integration, browser, visual regression), pair programming, code review, UI design systems.

Education

2011–15: Queen Mary University of London (London, UK)

Degree: Doctor of Philosophy (PhD) in Theoretical Physics (String Theory)

As a graduate student, I authored multiple papers published in peer-reviewed academic journals, presented talks at multiple academic institutions, and led Physics undergraduate classes.

2007–11: University of Cambridge (Cambridge, UK)

Degree: BA with MMath, Mathematical Tripos, First Class/Honours Pass

Interests

Coding

I've contributed to various open source projects, attended conferences and meetups on TypeScript, React, and GraphQL, and experimented in personal projects with Rust, Firebase, Serverless, Svelte, Flutter, TensorFlow, and LLMs.

Other

Board games, heavy metal, violin, folk, sci-fi, fantasy, festivals, travelling, running, craft beer...
